

KCM 08-1HR COOLMAX SOCK

- The ALPS residuum sock is manufactured via a specialised flat bed manufacturing process as to precisely control the shape and thickness of the sock. This process assures a even thickness and optimum fit.
- ALPS socks are elasticised to conform to the residuum shape. It also prevents the residuum sock from rolling down.
- The ALPS residuum sock does not lose thickness/volume over time. Thickness and softness is achieved by advanced manufacturing techniques and not by thinning the yarn.
- ALPS residuum socks wont stretch. Patented manufacturing methods produce a sock which minimizes stretch (up to 1/3 less stretch than with competitor's socks). This process further ensure that the Ply thickness is maintained for the lifetime of the sock.
